A KIRISITS M.J., Vardimon D., Kunz H.W., Gill T.J. III;
Submitted (JUN-1993) to the EMBL/GenBank/DDBJ databases.
C -!- FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and
TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.
C -!- SUBCELULIAR IOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
C -!- PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-21369/11; rumnu ... PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSF1A/TNFR1

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TMFRSFIA/TMFR1 (By

"Porcine tumor necrosis factor alpha: cloning with the polymerase chain reaction and determination of the nucleotide sequence.";

Gene 81:185-191(1989)

-i- FUNCTION: Cytokine that binds to TNFRSFIA/TNFRI and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             P23563;

1- SUBURIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).

1- PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

1- PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the

1: FUNCTION: Cytokine that binds to TNRFSF1A/TNFR1 and

TNFRSF1B/TNFB. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin I secretion and is implicated in the induction of cachesia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tumor necrosis factor precursor (TNF-alpha) (Tumor necrosis factor ligand superfamily member 2) (Cachectin).

Immunol. 155:3946-3954(1995).
FUNCTION: Cytokine that binds to INFRSFIA/INFR1 and FUNCTION: Cytokine that binds to INFRSFIA/INFR1 and INFRSFIB/INFRSFIB/INFRSFIA/INFR1. It is mainly secreted by macrophages and ca induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.
SUBCULTULAR LOCATION: Type II membrane protein. Also exists
                                                                                                                                                                                                                                                                                                                                                                                            proteolytic processing (By similarity). PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation

SUBUNIT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).
PM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form but not the soluble form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                . Immunol. 34:1041-1042(1997). FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and car induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of the contains the contains and the contains the contains and the contains the contains and the contains an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4 KDTPEGAELKPWY 16 ::||||||| ||||
                                                                                                                                                                             pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is

Vet. Immunol. Immunopathol. 82:183-192(2001)
-!- FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and
TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
pyrogen causing fever by direct action or by stimulation of
interleukin 1 secretion and is implicated in the induction of
cachexia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                        Tursiops truncatus (Atlantic bottle-nosed dolphin).

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages induce cell death of certain tumor cell lines. It is

SUBUNIT: Homotrimer (By similarity).
SUBUNIT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).
PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TNFRSF1A/TNFR1 (Existing the soluble to the soluble 
                                                                                                                                                                                                         SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.
